

“The use Six Sigma in a Computer System Validation Project in A GMP environment”

Author: Tania Ramos
 Advisor: Jose A. Morales Morales
 Industrial Engineering Department

Abstract

Computer Systems Validation is a process used to test, validate, and formally document that a regulated computer-based system does exactly what it is designed to do in a consistent and accurate manner that is secure, reliable and traceable. This is done under a very regulated environment. Biopharma industries uses computerized systems like The DeltaV™, that is an automation system that simplifies operational complexity. “The DeltaV™ is an easy-to-use system that simplifies operational complexity and lowers project risk. Six sigma is “business management strategy used by different industries to improve the quality of products or services produced by the business through the removal of defects and errors. The six-sigma methodology is to improve a process with a positive implication on quality of product or like in this case a service in the Information System Department to reduce the Computer System Validation delays in the IS Department to zero days in a GMP environment

Introduction

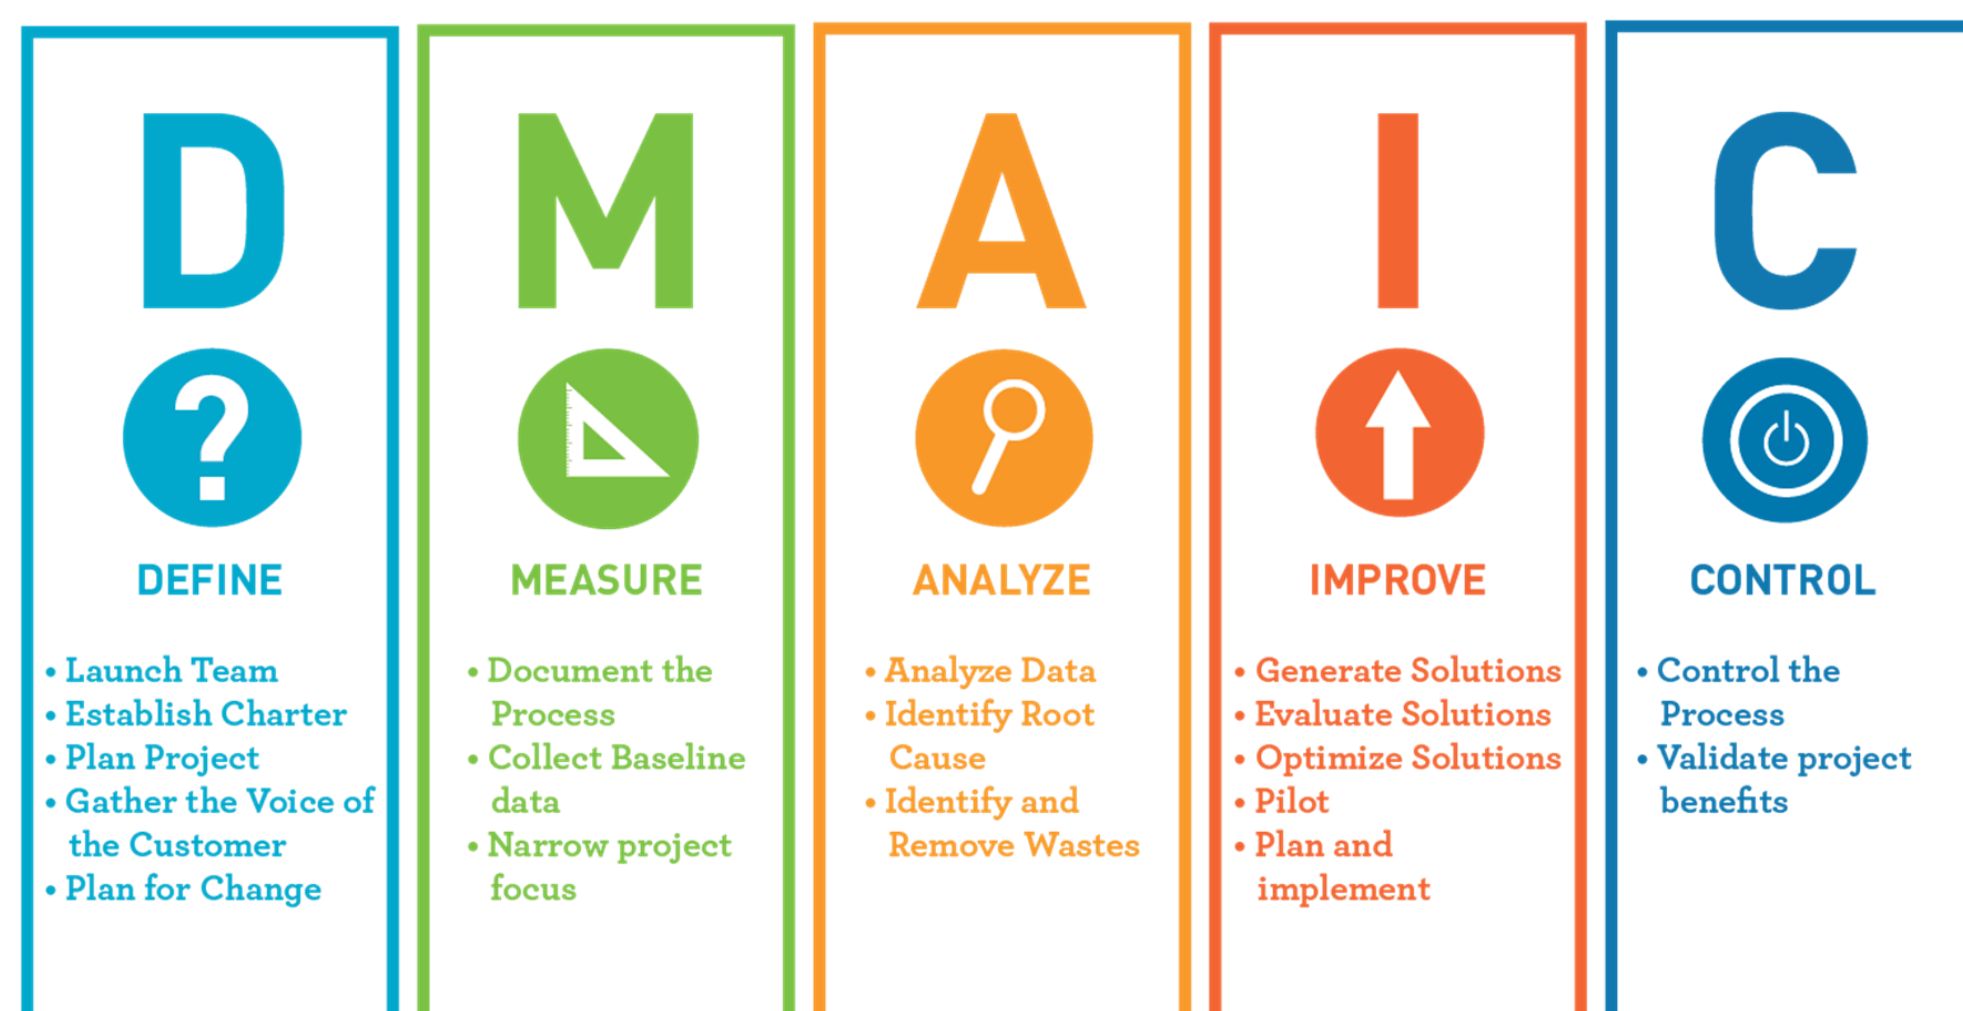

The Federal Drug Administration have a “General Principles of Software Validation guidance” and specified that Based on the intended use and the safety risk associated with the software to be developed, the software developer should determine the specific approach, the combination of techniques to be used, and the level of effort to be applied. “(FDA, 2002) All changes related to the system need to be validated withing the Information System/Automation department because this system (DeltaV™,) is classified as GXP system in the Biopharma. Changes in the code will be validated in an off-line testing environment and once the validation is approving the Automation Engineers will download the code to the production environment.

Problem

In order to reduce Computer System Validation delays will be investigating all deviation created in a period to analyze root causes to determine and implement a solution and to improve download to production withing the Automation department to production.

Methodology

The six-sigma objective is to improve a process with a positive implication on quality of product or like in this case a service in the Information System Department (IS). Six Sigma techniques and tools is a common approach to continuous improvement in a business sector and often include a framework tool called DMAIC that outlines a method of identifying and challenging sources of poor quality, and inefficient processes, looking for opportunities for improvement.

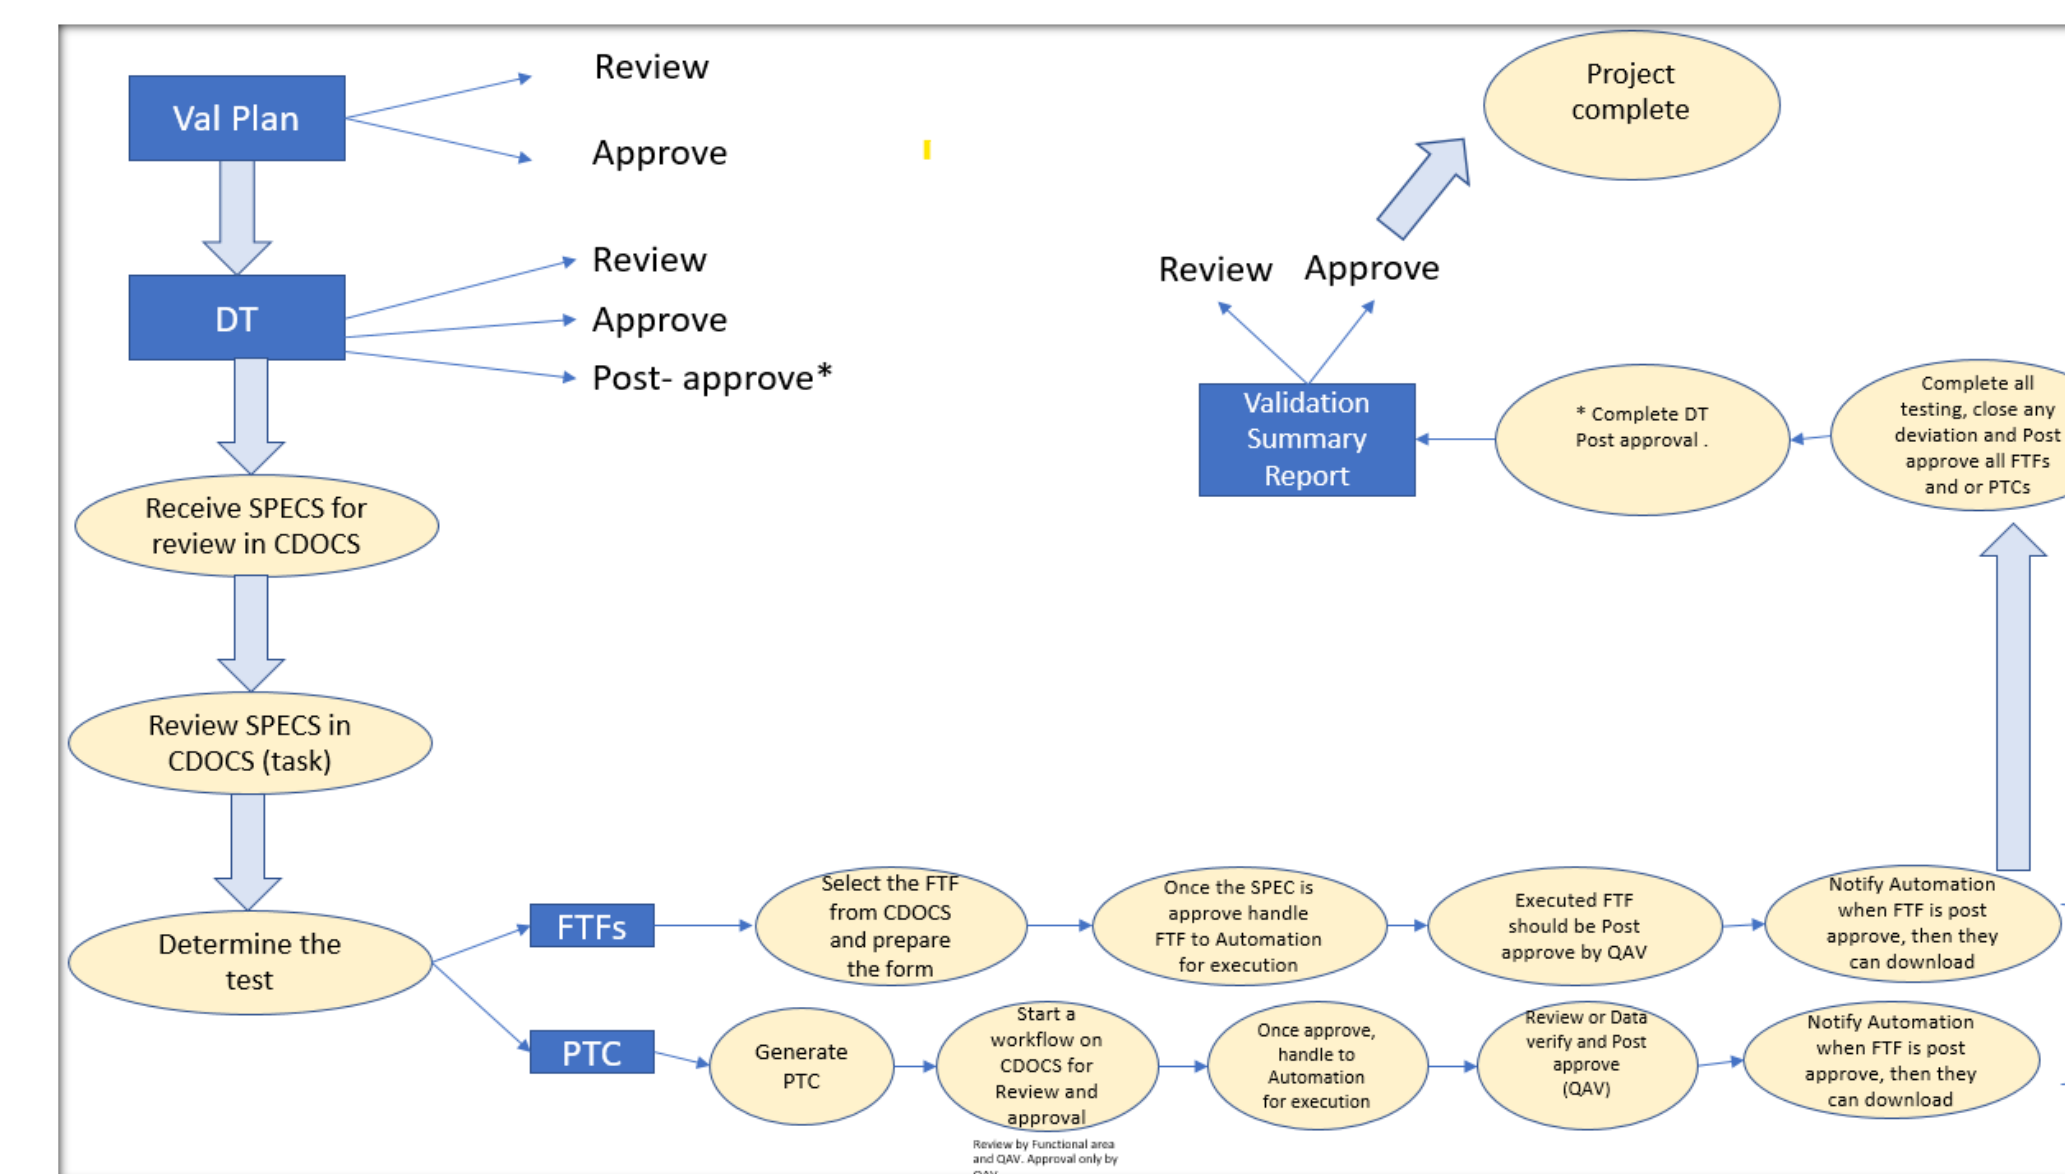

Results and Discussion

Define Phase

Project Charter																		
Project Name	The use Six Sigma in a Computer System Validation Project in A GMP environment*																	
Business Case	All deviation from the validation of DeltaV system in Q1																	
Problem/Opportunity	To reduce Computer System Validation delays will be investigating all deviation created in a period to analyze root causes to determine and implement a solution and to improve download to production withing the Automation department to production																	
Goal	Reduce Computer System Validation delays in the Information System/Automation department to zero days for Q2 2022.																	
Team Members	<table border="0"> <tr> <td>Computer System Validation Engineer</td> <td>Team Leader</td> </tr> <tr> <td>Quality Assurance Validation</td> <td>Team Member</td> </tr> <tr> <td>Quality Assurance Validation</td> <td>Team Member</td> </tr> <tr> <td>Automation Engineer</td> <td>Team Member</td> </tr> <tr> <td>Quality Manager</td> <td>Stakeholder</td> </tr> <tr> <td>Automation Manager</td> <td>Stakeholder</td> </tr> <tr> <td>IT Manager</td> <td>Sponsor</td> </tr> <tr> <td>CSM Manager</td> <td>Sponsor</td> </tr> </table>		Computer System Validation Engineer	Team Leader	Quality Assurance Validation	Team Member	Quality Assurance Validation	Team Member	Automation Engineer	Team Member	Quality Manager	Stakeholder	Automation Manager	Stakeholder	IT Manager	Sponsor	CSM Manager	Sponsor

Measure Phase

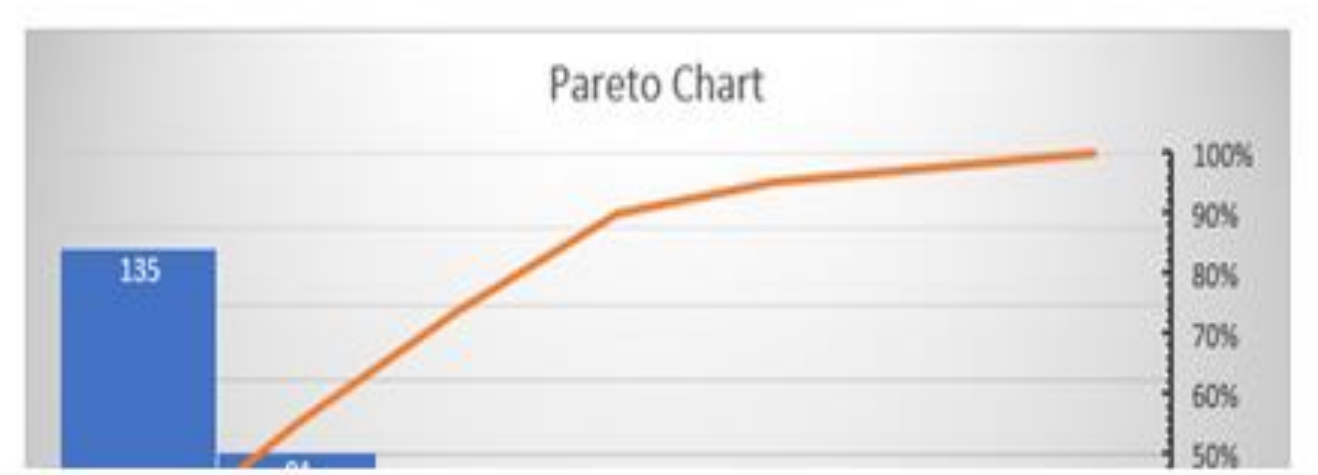

Process Map

Analyze Phase

Value Stream Mapping

Cause	Correlation Score	Total Value
Validation Plan approval	9	2.0%
Testing assessment	9	2.0%
Validation Summary report	21	5.0%
Deviations assessment	63	16.0%
Testing approvals	72	18.0%
SPECS review and approval	81	21.0%
Execucion	135	35.0%

0 No relationship between the input and the outputs
 1 Slight relationship between the input and the output
 3 Average relationship between the input and the output
 9 Direct relationship between the input and the output

Input (Y)	Down on time	No deviation	No re execution	Total Value	Total Value %
Input (Y)	9	3	3		
Validation Plan approval	1	0	0	9	2%
SPECS review and approval	9	0	0	81	21%
Testing assessment	1	0	0	9	2%
Execution	9	9	9	135	35%
Testing approvals	2	9	9	72	18%
Deviations assessment	3	9	3	63	16%
Validation Summary report	1	3	1	21	5%

Cause and Effect Matrix

Area	Effect	Root Cause
Delays in Specs review and approval	Testing delay	Different priorities from approvers
		Communication Schedule not updated
Execution	Testing delay impact the code download window	Re testing as per specs fails
		Re testing as per execution errors

Root Cause assessment

Change Control	Description	SPECS affected	SPECS review (days)		Specs approval (days)		Execution		Execution Total days			
			Expected	Actual	Expected	Actual	Functional Test Forms	Executions in Status		Deviations	Re-execution	Days in Execution
TR-028784	Remove Scan counter from purification Delta graphics	SPECS-432727	3	4	2	FTF-CV-01	Completed	0	N/A	No	3	3
						FTF-CV-02	Completed	0	N/A	No	3	3
						FTF-CV-03	Completed	0	N/A	No	3	3
						FTF-CV-04	Completed	0	N/A	No	3	3
						FTF-CV-05	Completed	0	N/A	No	3	3
Total						5	0	0	0	0	15	15

Process Data Collection

Change Control	Description	SPECS affected	SPECS review (days)		Specs approval (days)		Execution		Execution Total days			
			Expected	Actual	Expected	Actual	Functional Test Forms	Executions in Status		Deviations	Re-execution	Days in Execution
TR-038224	Chrome TOC update	3	4	2	FTF-CV-01	Completed	0	N/A	No	3	3	
					FTF-CV-02	Completed	0	N/A	No	3	3	
					FTF-CV-03	Completed	0	N/A	No	3	3	
					FTF-CV-04	Completed	0	N/A	No	3	3	
					FTF-CV-05	Completed	0	N/A	No	3	3	
Total						5	0	0	0	0	15	15

Process Data Collection

Improve Phase

Change Control	Description	SPECS affected	SPECS review (days)		Specs approval (days)		Execution		Execution Total days			
			Expected	Actual	Expected	Actual	Functional Test Forms	Execution Status		Deviations	Re-execution	Days in Execution
TR-002027	Remove Batch reports and engineer applications from DeltaV Graphics	SPECS-410230	3	3	2	FTF-CV-01	Completed	0	N/A	No	3	3
						FTF-CV-02	Completed	0	N/A	No	3	3
						FTF-CV-03	Completed	0	N/A	No	3	3
						FTF-CV-04	Completed	0	N/A	No	3	3
						FTF-CV-05	Completed	0	N/A	No	3	3
Total						5	0	0	0	0	15	15

Implemented Solutions	
Priorities	PM assigned, timed monitored
RE-executions	Automation Eng. Include revisions in their internal testing
Executions	Validation eng included during the executions as a verifiers Validation Eng creates a Smarsheet including all the execution steps, tracking any delays. Smarsheet monitored by the PM

Post Implementation Process Data Collection

Change Control	Description	SPECS affected	SPECS review (days)		Specs approval (days)		Execution		Execution Total days			
			Expected	Actual	Expected	Actual	Functional Test Forms	Execution Status		Deviations	Re-execution	Days in Execution
TR-032791	Harvest vessel modification	SPECS-490698	3	3	2	FTF-CV-01	Completed	0	N/A	No	3	3
						FTF-CV-02	Completed	0	N/A	No	3	3
						FTF-CV-03	Completed	0	N/A	No	3	3
						FTF-CV-04	Completed	0	N/A	No	3	3
						FTF-CV-05	Completed	0	N/A	No	3	3
Total						5	0	0	0	0	15	15

Method

σ_1 standard deviation of Pre Implementation
 σ_2 standard deviation of Post Implementation
 Ratio: σ_1/σ_2

Descriptive Statistics

Pre Implementation: N=12, StDev=0.996, Variance=0.992, 95% CI for σ (0.455, 2.605)
 Post Implementation: N=12, StDev=0.389, Variance=0.152, 95% CI for σ (0.158, 1.148)

Ratio of Standard Deviations

Estimated 95% CI for Ratio using Bonett: 2.59930 (0.619, 13.125)
 using Levene: (-1, -)

Test

Null hypothesis: $H_0: \sigma_1/\sigma_2 = 1$
 Alternative hypothesis: $H_1: \sigma_1/\sigma_2 \neq 1$
 Significance level: $\alpha = 0.05$

Test

Method: Bonett, Statistic: 1.97, DF1: 1, DF2: 22, P-Value: 0.161
 Levene: 1.82, 1, 22, 0.191

Variance Test Analysis

Control Phase

Deviation tracker
 • Responsible: Validation Engineer
 • Description: Create, update and share with Team members and stakeholders
 • Method: Smarsheet
 • Frequency: Weekly

Priorities
 • Responsible: Project Manager
 • Description: Create schedules with cross functional department input
 • Method: Standup meetings, Project Meetings
 • Frequency: Each Change Control

SOP and Work Instruction
 • Responsible: Automation Engineer
 • Description: Update SOPs and Work Instructions guidelines to include internal reviews requirements
 • Method: Documents
 • Frequency: Before the project closure

Conclusions

The problem stated in this project has been solved: as shown in 5 the Six Sigma methodology section implemented with the DMAC tools represent consequent stages within Six Sigma implementation roadmap to reduce the delays in the coding the download to production in the Information System/Automation department.

Most important findings

- Internal testing is key in the process. Taking time for testing before the actual validation made a difference.
- Adding resources to the process like including a verifier demonstrate that deviations and time reduce significantly.
- Tracking tools – robust tracking tools and monitoring them helped the Automation department to had visibility on the time
- Project Manager - facilitates the project timeline to reduce any delays.

Future Work

There are some gaps in our knowledge around the Computer System Validation delays in research that follow from our findings, and would benefit from further research, including realist evaluation to extend and further test the theory we have developed here:

- In-depth exploration of how Change control can influence in the code downloading delays.
- Research could explore the types depending on the system change, that can include, parameters, graphics, recipes, formulas o phases and how these changes may impact the coding. Opportunity to explore the implementation of the finding solutions to another system beside this one (DeltaV), Logmate, RT reports or any other computerize system. Research could explore which systems may adapt to implement Sig Sigma in their process.
